Grogoni Frontend Redesign Specification

Version: 2.0

Status: Proposed UI Redesign

Platform: Mobile-first Progressive Web App (PWA)

Purpose

This document defines the redesign of several Grogoni screens that currently feel visually cluttered. The redesign moves the application toward a chat-first, agent-first, and business-card driven experience.

The objective is to make the interface feel as simple as messaging someone on WhatsApp while still exposing powerful commerce functionality.

The sketches embedded throughout this document serve as the visual reference for implementation.

Design Philosophy

The redesign follows these principles:

- Mobile-first
- Chat is the primary interface
- AI Agent is always the first point of interaction
- Every business operation should be accessible through generated business cards
- Remove unnecessary menus
- Reduce screen clutter
- Keep important actions within thumb reach
- Optimized for low-end Android devices
- Fast loading
- Existing users should automatically load into their previous workspace

---

Screen 1 — Login

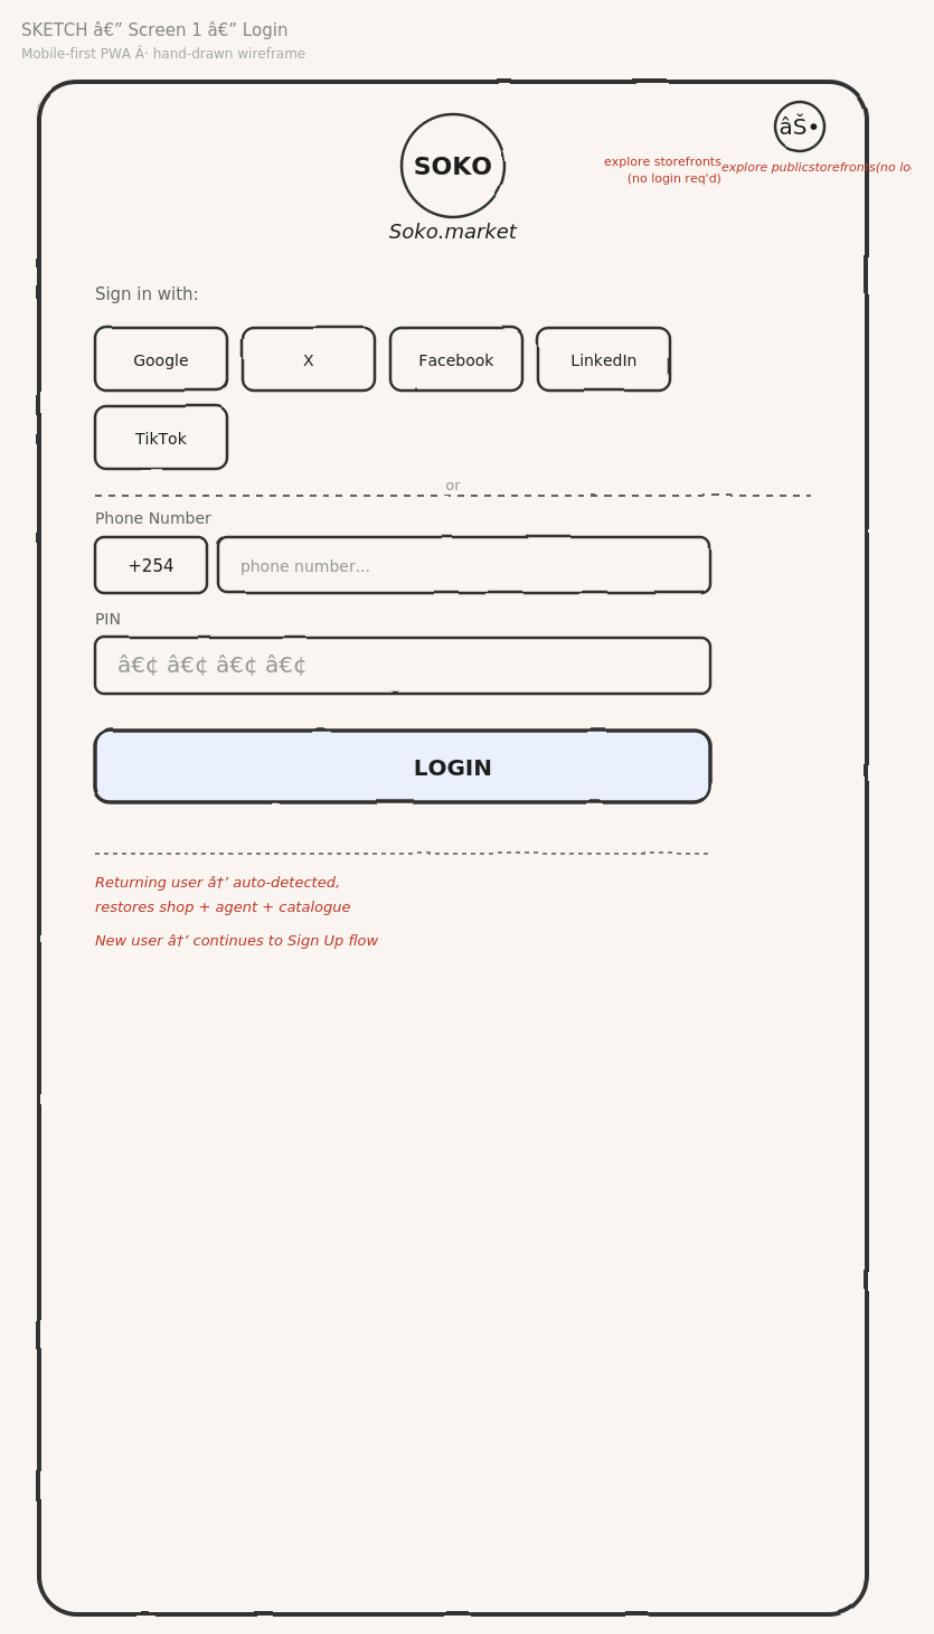

Fig. 1 — Login screen wireframe sketch

Objective

Create an extremely simple login process.

Layout

Top

- Grogoni logo

Upper section

Authentication methods:

- Google
- X
- Facebook
- LinkedIn
- TikTok

Alternative login:

- Phone Number — +254 | Phone Number
- PIN

Primary Button: Login

Top right: World icon — allows users to explore public storefronts without logging in.

Behaviour

Returning users:

- previous account detected automatically
- loads existing business
- restores previous agent
- restores previous catalogue

New users: continue through signup flow.

Screen 2 — Sign Up

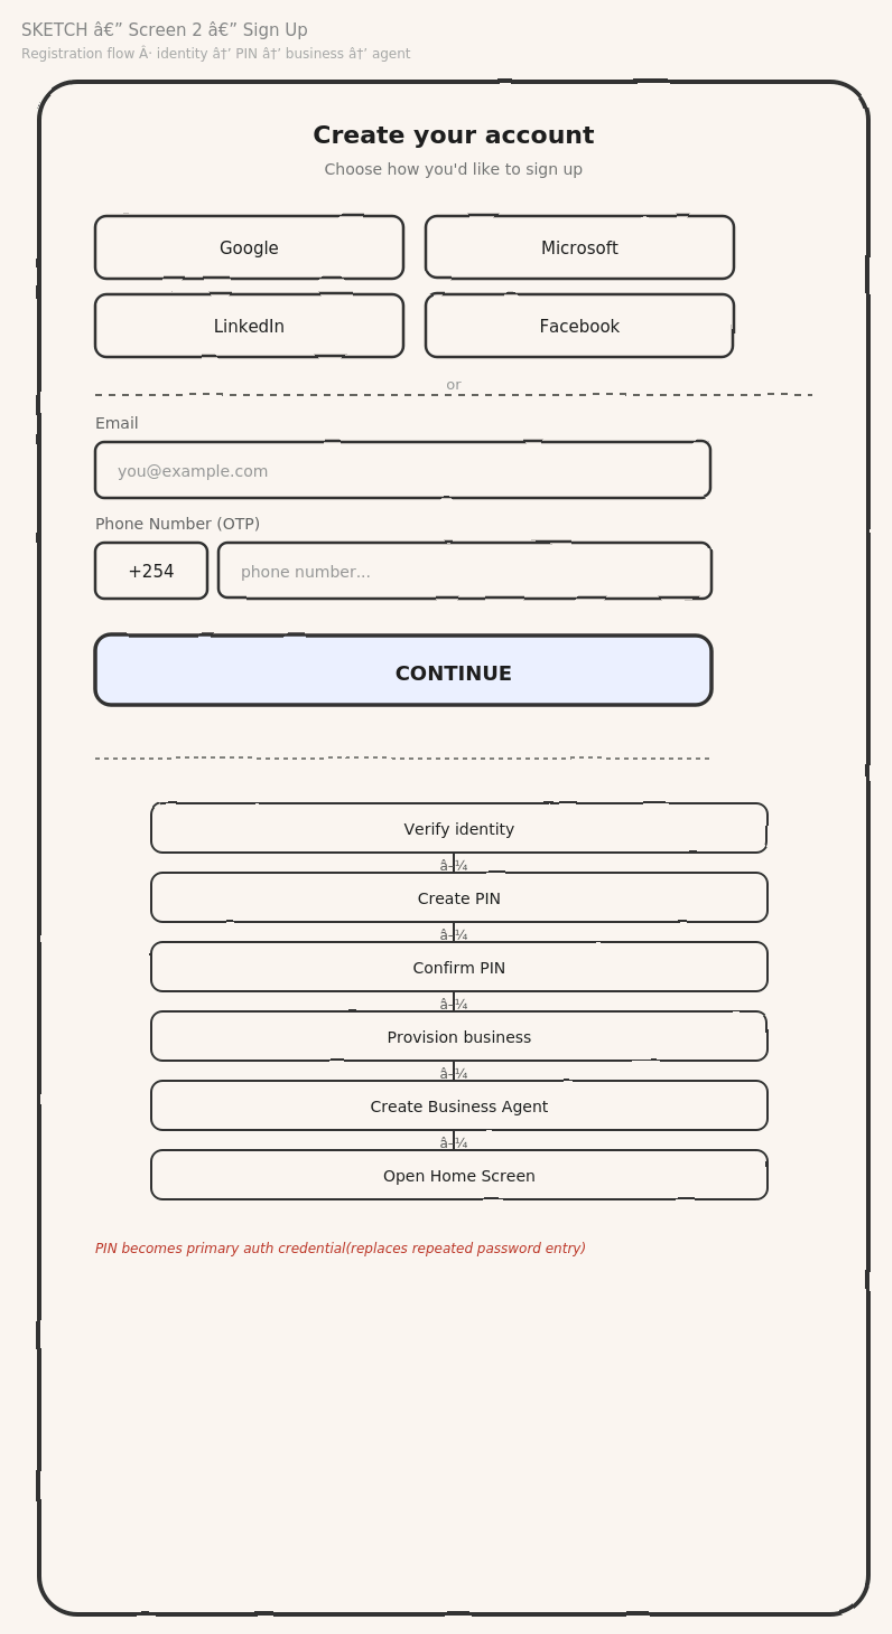

Fig. 2 — Sign Up screen wireframe sketch

Goal

Allow users to register using whichever identity they already own.

Supported methods

- Google
- Microsoft
- LinkedIn
- Facebook
- Email
- Phone Number (OTP)

Registration Flow

Choose authentication → Verify identity → Create PIN → Confirm PIN → Provision business → Create Business Agent → Open Home Screen

PIN

PIN becomes the user's primary authentication credential.

The PIN is used instead of repeatedly entering passwords.

Screen 3 — Home Screen

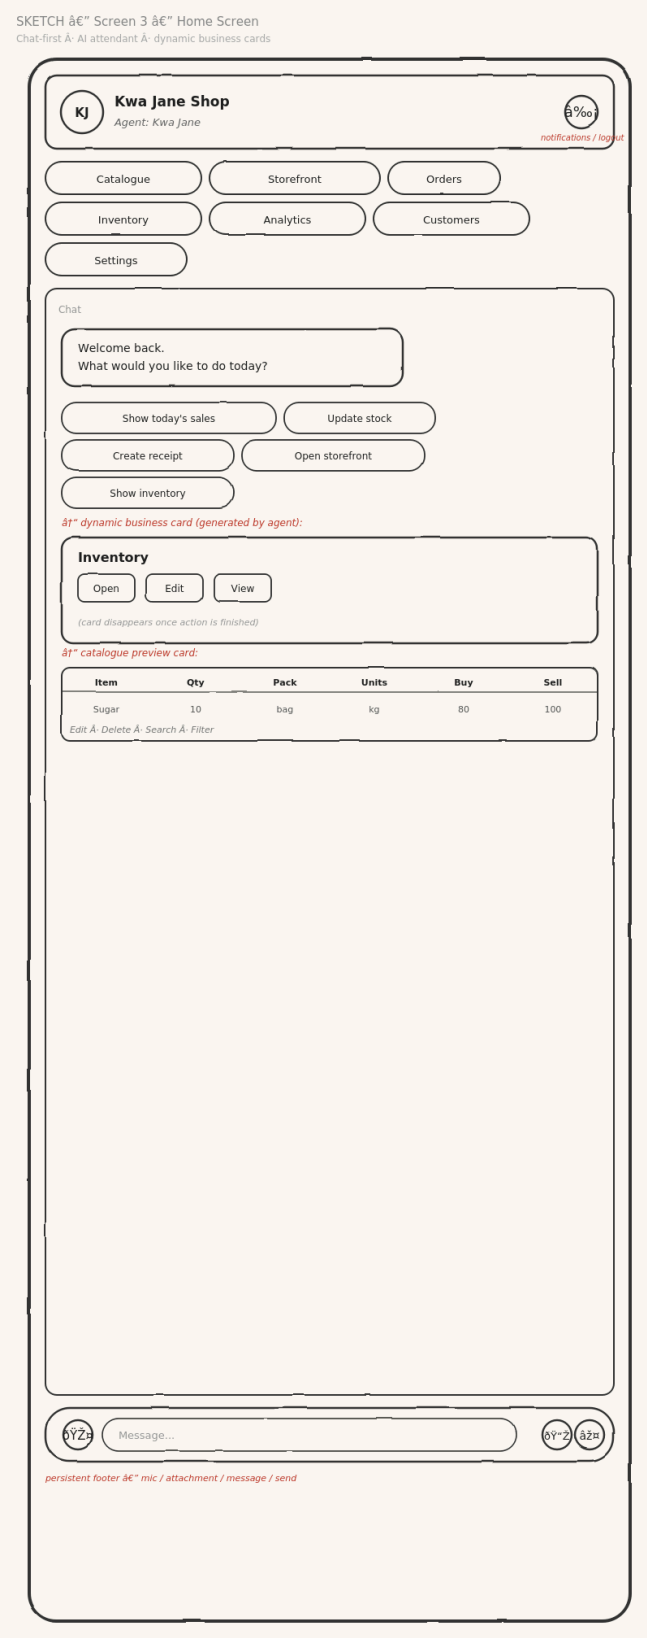

Fig. 3 — Home screen wireframe sketch

This becomes the application's main interface. Everything revolves around the AI attendant.

Header

Contains:

- Business Name — Kwa Jane Shop
- Business Agent — Kwa Jane

Business Cards — these cards provide contextual access to:

- Catalogue
- Storefront
- Orders
- Inventory
- Analytics
- Customers
- Settings
- Notifications
- Logout

Chat Window

Occupies almost the entire screen.

Example:

"Welcome back. What would you like to do today?"

Possible replies:

- Show today's sales
- Update stock
- Create receipt
- Open storefront
- Show inventory

Dynamic Business Cards

Instead of navigating menus, the AI generates action cards.

Example — Inventory:

- Open
- Edit
- View

Another — Orders:

- Pending
- Completed

These disappear once finished.

Catalogue Preview

Instead of opening another page, the agent generates a catalogue card.

Columns:

- Item
- Quantity
- Packaging
- Units

- Buying Price
- Selling Price

The user can Edit, Delete, Search, Filter — without leaving chat.

Screen 4 — Storefront Window

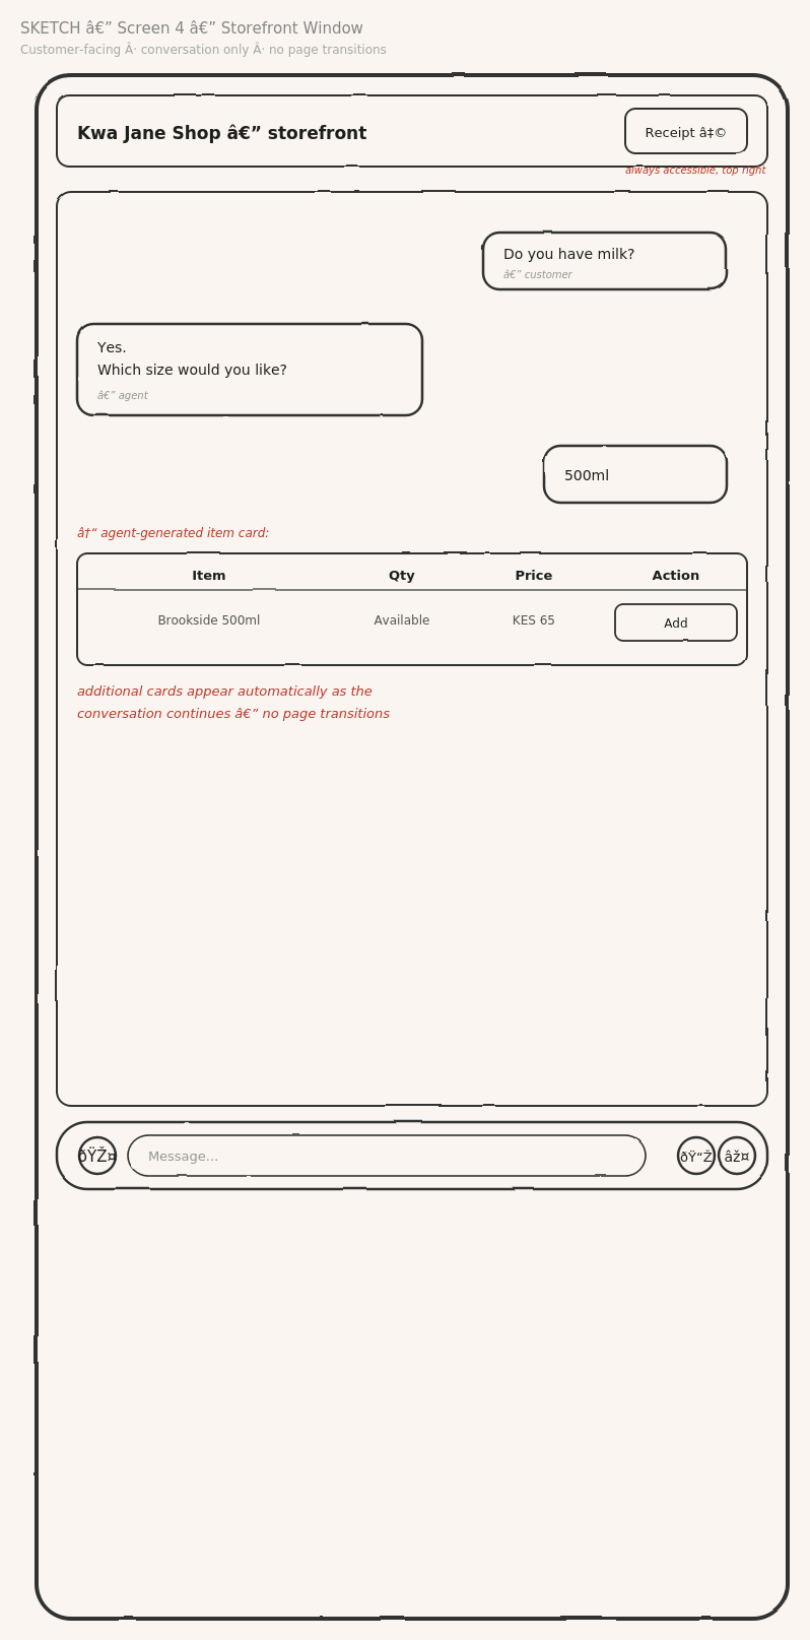

Fig. 4 — Storefront window wireframe sketch

This screen is customer facing. Customers only interact through conversation.

Example

Customer: "Do you have milk?"

Agent: "Yes. Which size would you like?"

Customer: "500ml"

Agent generates:

- Item | Qty | Price | Action
- Brookside 500ml | Available | KES XX | Add

Additional cards appear automatically. No page transitions.

Receipt Button

Always accessible — top right.

Produces receipt:

- Share
- Print
- Download

Screen 5 — Business Card Editor

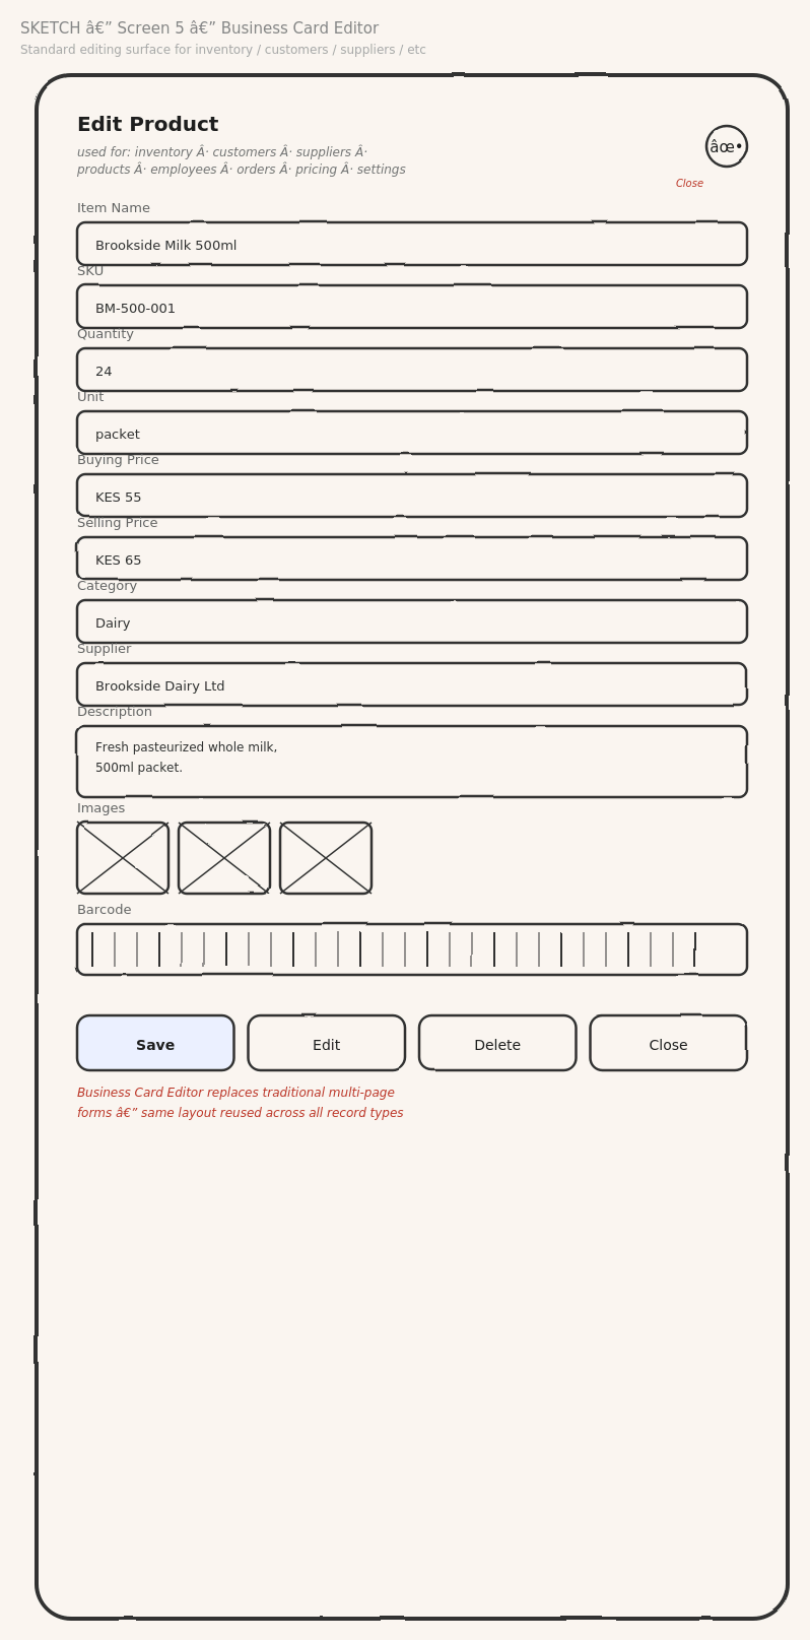

Fig. 5 — Business Card Editor wireframe sketch

The business card becomes the standard editing interface.

Used for:

- Inventory
- Customers
- Suppliers
- Products
- Employees
- Orders
- Pricing
- Settings

Example Fields

- Item Name
- SKU
- Quantity
- Unit
- Buying Price
- Selling Price
- Category
- Description
- Images
- Barcode
- Supplier

Buttons:

- Save
- Edit
- Delete
- Close

Conversation Driven Commerce

The redesign removes traditional navigation. Instead users simply ask.

Examples:

- "Add sugar" → Agent generates inventory card.
- "Show all milk" → Agent generates catalogue card.
- "Create receipt" → Receipt card appears.
- "Edit Brookside Milk" → Product editor opens.

Persistent Footer

Bottom of every screen:

- Microphone
- Attachment
- Message Box
- Send Button

This keeps every workflow conversational.

Automatic Workspace Recovery

When an existing user logs in, Grogoni restores:

- Agent
- Shop information
- Inventory
- Catalogue
- Orders
- Storefront configuration
- Customer records
- Previous conversations
- Preferences

No setup should be required after authentication.

Expected UX Improvements

The redesign aims to achieve:

- Fewer clicks
- Less visual clutter
- Faster product lookup
- Faster inventory management
- Faster storefront interactions
- Better discoverability through AI
- Reduced learning curve
- Consistent chat-first experience
- Better performance on low-end smartphones
- A unified interface where every business action starts with a conversation
