Grogoni Frontend Redesign Specification

This document captures the proposed redesign for the remaining screens that currently feel visually busy. The objective is to create a mobile-first, chat-first interface with fewer distractions, clearer hierarchy, and business-card driven workflows.

1. Login Screen

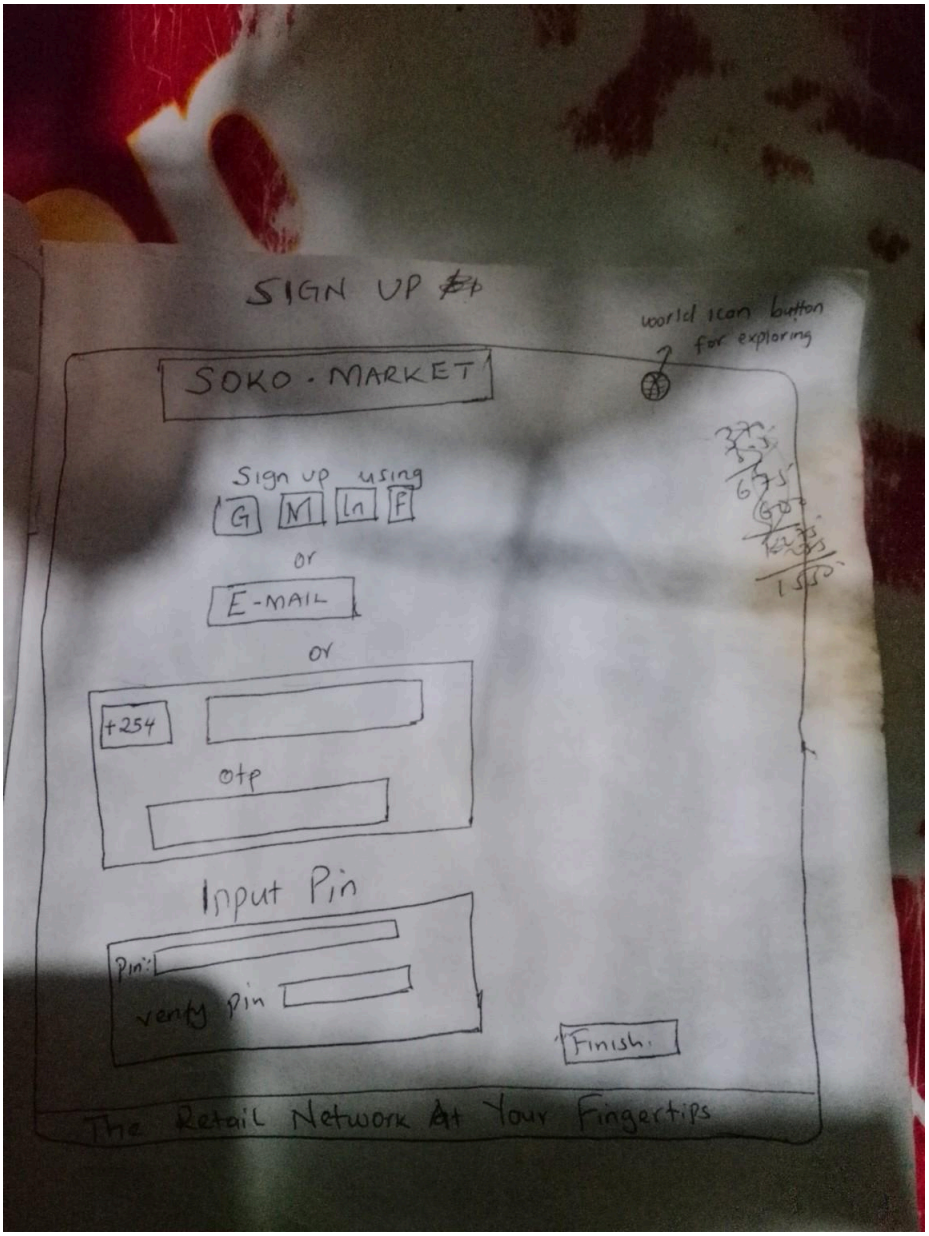

Simplify authentication. Keep social sign-in options at the top, followed by phone/email login. Use a clean PIN entry and minimize visual clutter. Retain the globe icon for exploration.

Sketch illustration

2. Sign-up Screen

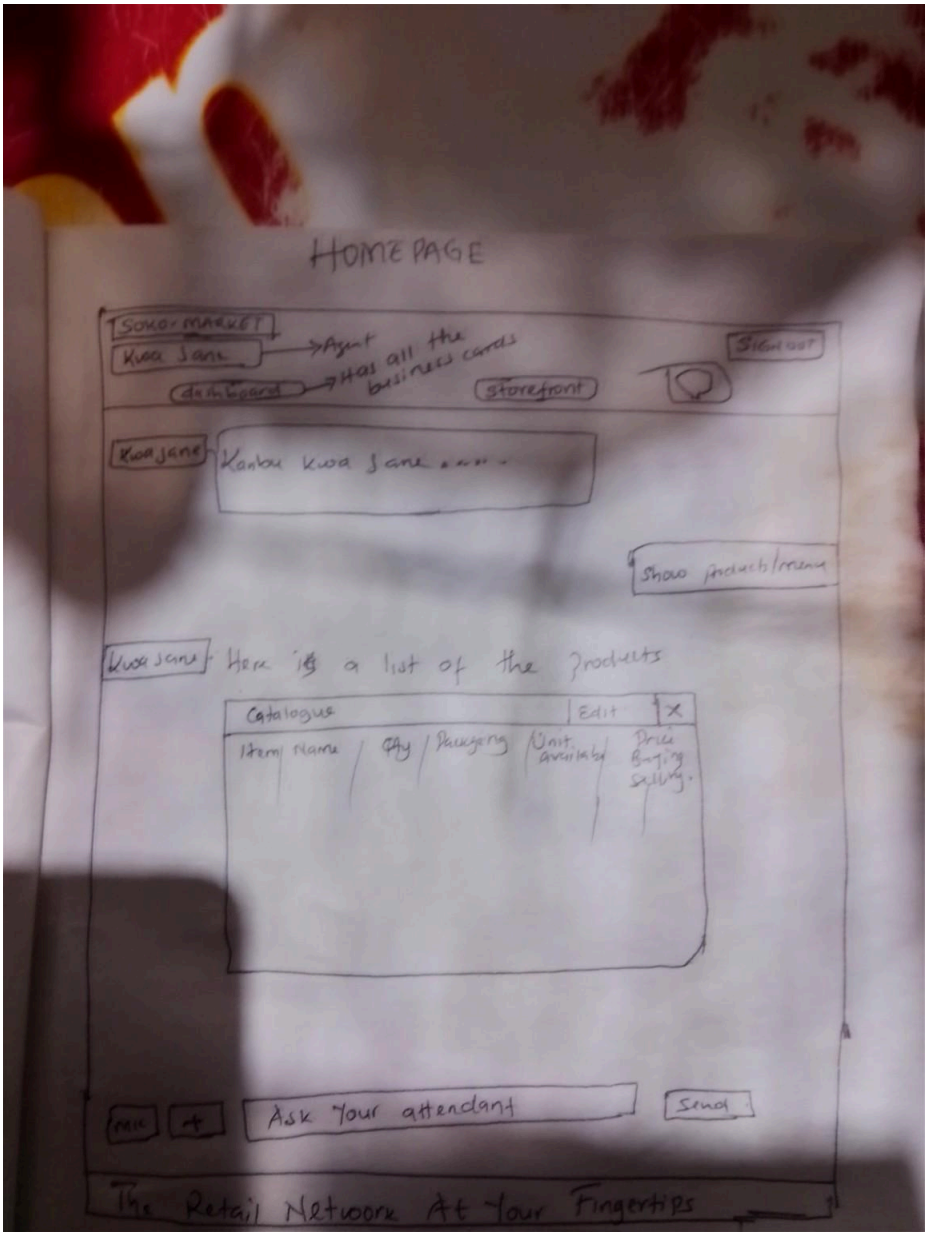

Support sign-up via Google, Microsoft, LinkedIn, Facebook, email, or phone with OTP. After verification, prompt the user to create a PIN before entering the application.

Sketch illustration

3. Home Screen

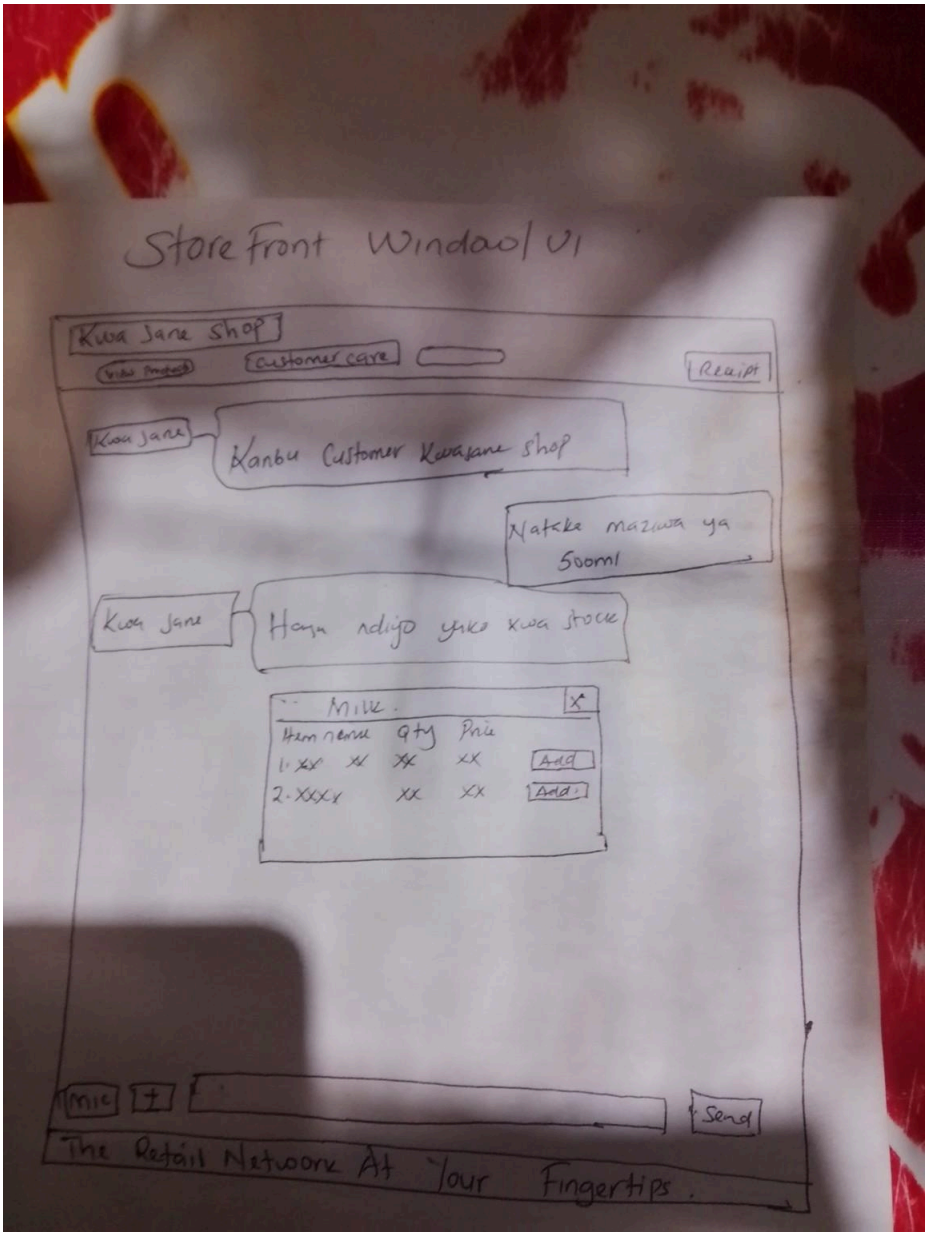

The agent becomes the primary interface. Business cards are generated inside chat. Catalogue and storefront actions appear as contextual cards instead of persistent menus.

Sketch illustration

4. Storefront Window

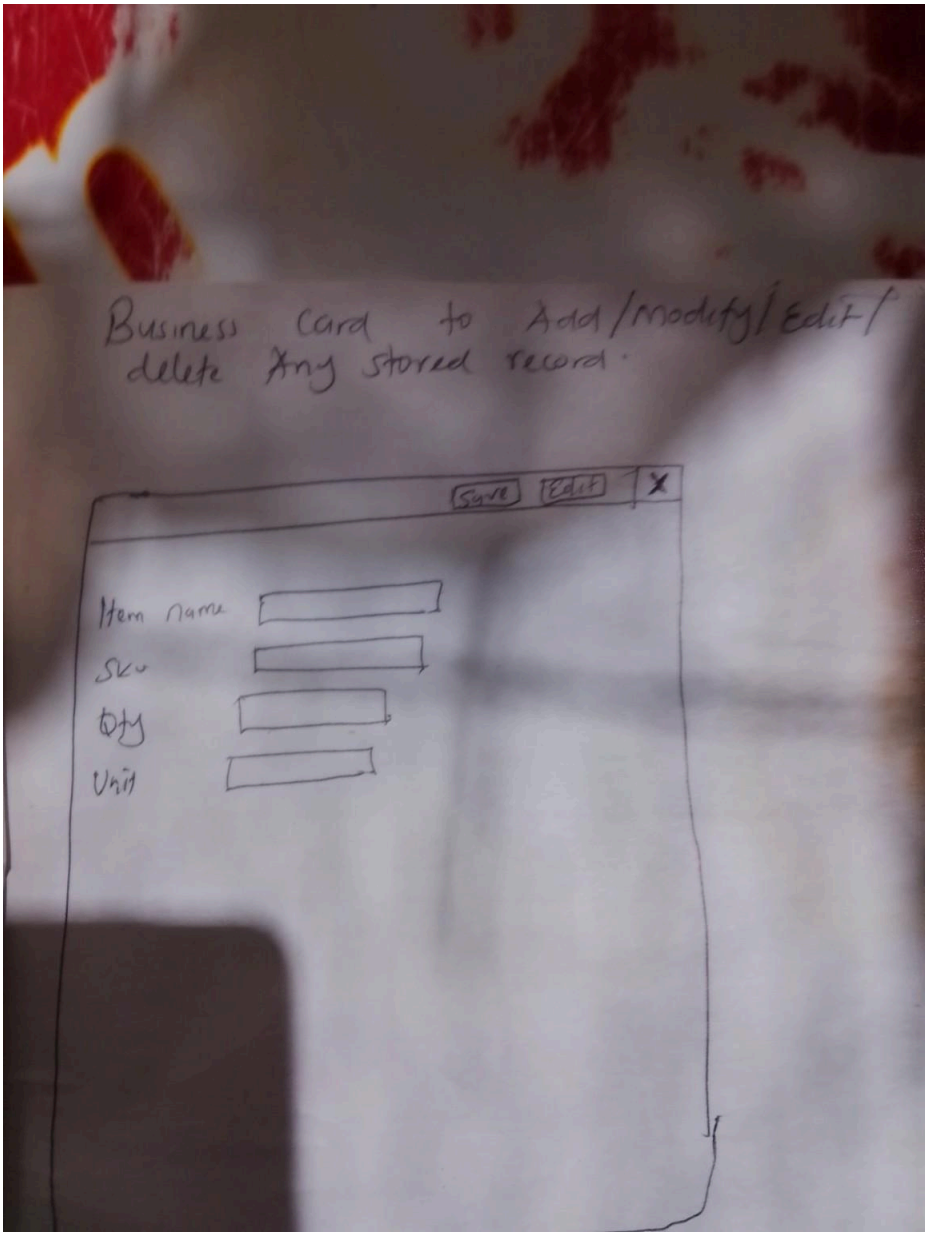

Customers interact with the shop entirely through conversation. Product suggestions appear as compact cards with Add actions. Receipt remains accessible from the header.

Sketch illustration

5. Business Card Editor

Inventory records are managed through a lightweight card. Allow create, edit, save, and delete with only the required fields visible.

Global Design Principles

- Mobile-first.
- Chat is the primary UI.
- Reduce persistent controls.
- Business cards provide contextual actions.
- Existing users should automatically load their saved data after authentication.
- Fast performance on low-end Android devices.
